Retail Business Performance Analysis

Introduction

Name: Adheje B

Role: (Data Analyst / Student)

Tools: Excel | Power BI | Streamlit

- **Objective:** Analyze retail data to understand revenue drivers and business performance
- **Tools Used:** Excel, Power BI, Streamlit
- **Outcome:** Built an interactive analytics system for decision-making

Problem Understanding

- Retail businesses generate large transaction data
- Lack of structured insights limits decision-making

Need to identify:

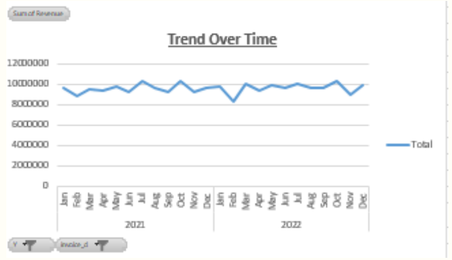
- Key revenue drivers
- Underperforming areas
- Growth opportunities

Goal: Convert raw data into actionable business insights.

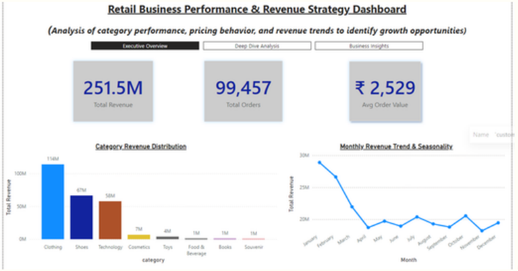
Approach

- Data cleaning and validation
- KPI creation (Revenue, Orders, AOV)
- Dashboard development
- Insight extraction
- Live deployment

Excel (EDA)

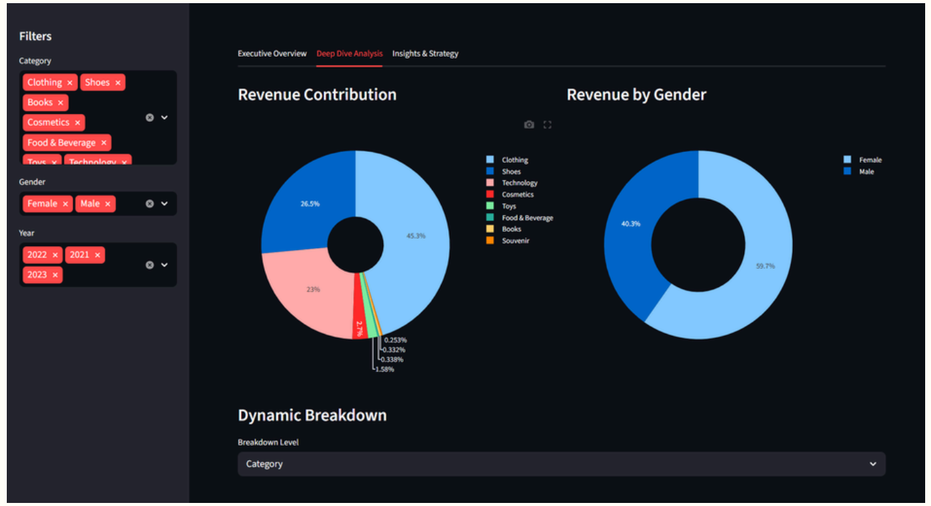


Power BI (Dashboard)

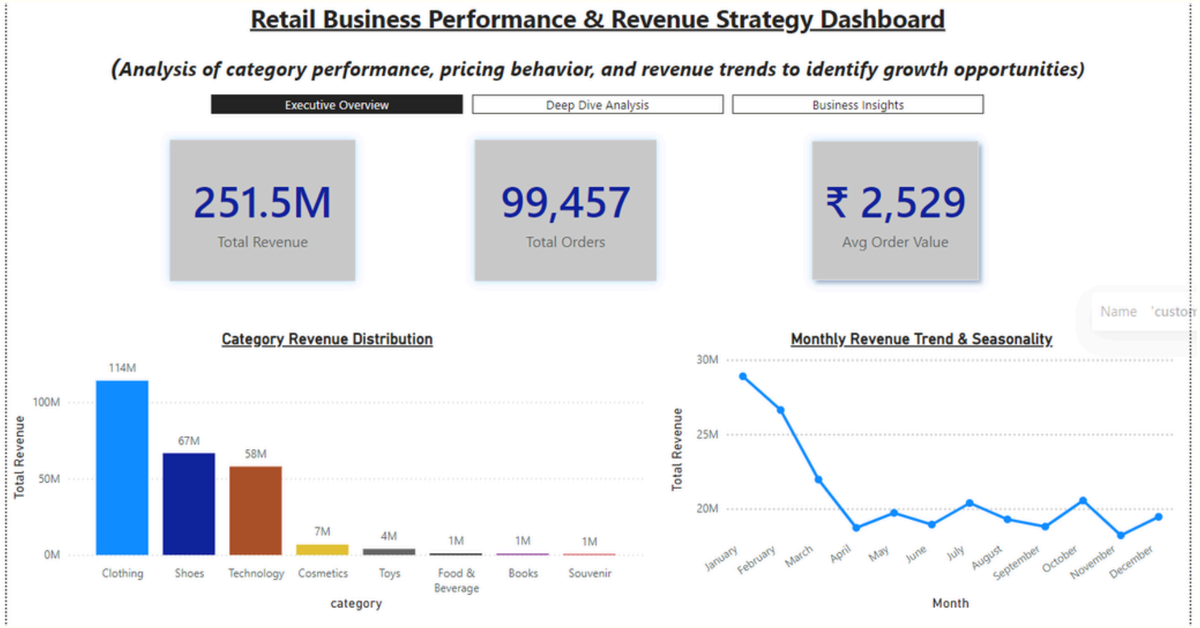


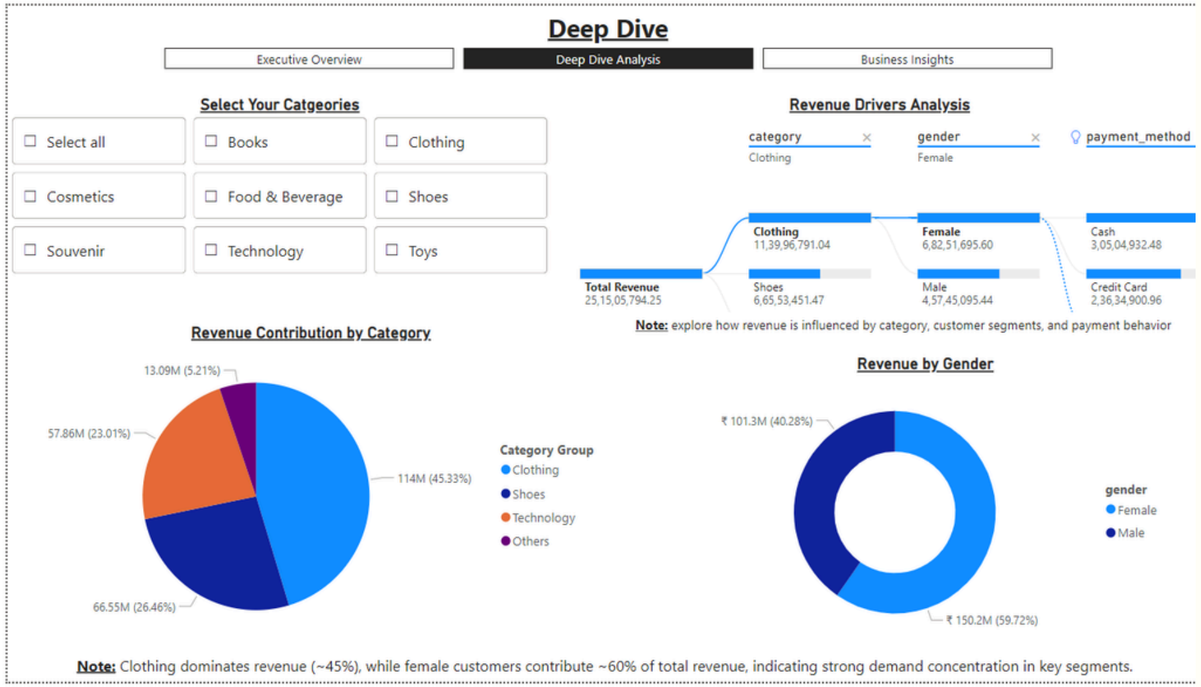
Streamlit (Deployment)

Dashboard Overview(Deployed)



Dashboard Overview(Power BI)





Key Insights

- Clothing contributes ~45% → dependency risk
- Top 3 categories ≈ 95% revenue
- Technology = high-value, low-volume (premium)
- Female customers ≈ 60% revenue
- Revenue trend is stable, not growing

Strategic Recommendations
Focus on expanding premium segments (Technology)
Reduce dependency on Clothing
Improve margins in low-value categories
Leverage seasonal peaks for targeted campaigns

Conclusion

Business is highly concentrated and stable but not scaling

Opportunities:

- Expand premium categories
- Diversify revenue sources
- Optimize low-margin segments

Data-driven decisions can significantly improve growth and risk management.
